

Spray Your Dies Based on the Die Temperature

Advance's reciprocating die spraying technology can now be interfaced with the {rokbox text=|temperature control units|}images/stories/advance/tool-temp/tt-388-dual.jpg{/rokbox} to achieve the ultimate in die spray release control.

In addition to spraying the die based on a fixed program, you can now have override capability and have variable spray from shot to shot based on the die's temperature. If the die's temperature rises, the Tool-Temp unit tells the reciprocator to spray more, thus maintaining the temperature. If the die starts to cool, the Tool-Temp signals the sprayer to spray for less time. The temperature control interface (TCI) is truly a very productive tool for modern die casters. With Tool-Temp and Advance working in conjunction with each other, you have a highly productive tool that can provide you with more consistent quality castings.
